

CONTROLLER AREA NETWORK (CAN)

The CAN protocol is an ISO standard for serial data communication. The ECM forms a network with other components linked with the CAN bus. The network comprises the:

- ECM
- Multifunction gauge
- THCM (thermocouple module) on the Summit 800R E-TEC

Two wires connect each component and they are in constant communication within the network. CAN lines consist of a pair of wires (WHITE/BEIGE and WHITE/BLACK).

Fault codes are broadcasted to the CAN bus. They can be displayed:

- In B.U.D.S via the diagnostic connector
- In the premium gauge
